WHOLE BANKING, FINAL · COMPONENT AUDIT · ROUND 2 COMPANION

Every "Instance + overrides" section, and how to fix it.

The 0 sections built from a master but edited on the page in ways the master does not offer as options. Each has a plain note and the cleanest fix.

Notes by Mason, Olivia and Sophia

HOW TO READ THIS

Three kinds of fix, plus false alarms.

Document as an option	The page made a sensible variation. Add it to the master's documented options, and the section becomes a plain Instance with no page change.
Re-sync to the master	The change looks accidental or unnecessary. Restore the master's structure on the page, keeping the content.
Convert to another master	The section is really a different component. Swap it for an instance of that master.
No change needed	On a closer look the section is a clean instance; the scanner was too strict. It will show as Instance in the next audit.

Masters with the most overrides

MASTER	SECTIONS

Fixing a master's options once can clear many rows: one documented option turns every page that uses it green.

RESULT

No Instance + overrides sections remain.

Every section that was built from a master but edited on the page has been resolved: the variation was documented as an option in its master, the section was re-synced to the master, or it was converted to the master it really is. Each one is now tagged with data-master and counted as an Instance in the component usage audit.
